Monday, 08 February 2010

We all know that the ARM Cortex CPU is one of the hottest microprocessors fitted inside smartphones. Generally, the company is already planning for more ARM processors in the near future, whereby the company mentioned that they will be unveiling 3 new ARM Cortex processors this year.

On the other hand, you can expect these microprocessors to be outfitted on smartphones, digital TV products, mobile computing devices, and etc. ARM has also disclosed that they will be producing much small multi-core processors which will be based on the 28nm architecture, whereby these processors are destined to be shipped on 2012.

Well I m already highly enthusiastic over ARM s development for these microprocessors. I m thinking that we, as consumers, will have access to much powerful microprocessors on mobile computing devices, in the future.
