Just when Intel released their latest Pinetrail processors into the market, majority of the netbook manufacturers adopted this particular technology, as clearly, it boasts extended battery life for these mobile computing devices. And if you take a look at Samsung, they did incorporate the Pinetrail processor into their N310 and N315 netbooks respectively. Generally, the N315 netbook has been given an overhaul, whereby it will now run with the Atom N450 processor. Also, this particularly rubbery netbook comes with 1GB of RAM, Intel GMA 1350 graphics, and it even runs on the latest Windows 7 starter edition.

Well if you like to have longer battery life for your mobile computing devices, perhaps you should seriously take a look at the Samsung Go N315. The netbook is available for purchase for \$429, which I find to be rather affordable.
