Thursday, 11 March 2010

Earlier on, Dell tried their hands in the mobile computing market, whereby they have unveiled to the world, the very first Dell mobile phone. Nevertheless, it also seems that Dell is making tremendous progress in their miniature mobile computing devices, whereby they have recently released news via their flyers, showing several Mini 5 which features an assorted range of color options for consumers.

Nevertheless, the Mini 5 actually comes with a sleek 5-inch WVGA touchscreen display, and it even comes with 800x480 resolution as well. There s a VGA camera at the front, presumably that you can use for video chats, there s capacitive touch front buttons as well, an autofocus camera with flash, and there s even a 30-pin docking connector.

Not sure when Dell will release the Mini 5, but I m thinking pretty soon, since the flyers are ready right?
